As the sequel to Happy Feet, the game was also created by the Voodoo digital and Ubisoft Montpellier teams. It was released on January 13, 2007 in North America and on April 12, 2007 in Europe. The game is based on the original Happy Feet trailer, and can be installed on top of Happy Feet. The game is played from a first-person perspective, and features more than 40 characters, each with different abilities and personality traits, including the Penguin, the Otter, the Red Bird, Boomer, Poppy, Froggy and others. In Happy Feet 2, the penguins travel on the sea, searching for food, battling predators and avoiding dangers. During the journey, the penguins will travel from a tropical paradise to a cold frozen sea. The player controls several characters, who are controlled through a guide, displayed on-screen. When playing certain characters, the player can choose to fight, eat or assist characters in distress, which will add experience points to their current character, as well as unlock new outfits, and new music and movies. The guide will also point out items to collect. The characters can be changed at any time. The animals must swim, fight, and eat to avoid capture by predators. The players can use simple gestures to control the different characters. These gestures include moving the cursor to select characters to fight, eat or free from capture, touching and holding the character to make them run or walk, lifting and dragging the mouse to move the characters, and to punch and kick. Happy Feet 2 features six different songs, each with a corresponding cast of characters and a battle theme. Happy Feet 2 features more than forty penguins to interact with, including those who have never been featured in the Happy Feet movie series. It was also stated in a press release from Ubisoft that the developers aimed to create characters who were more "animated and human-like." Happy Feet 2 provides access to a mobile phone, which can be used to 77a5ca646e

Some files can be opened only by specified applications. For example, it is impossible to open and edit a Microsoft Word document unless you have Word installed on your computer. The same way, there are programs which can open and edit only selected files, or even open and edit only files that are marked as a type that this program can edit. In the example above, the text editor Microsoft Word is able to open the file simply because this type of file is associated with the application that was last used to edit it. The example above shows a simple association of the Microsoft Word application with the PDF document. It is important to know that association is dynamic. If another application is used to edit the file and then the association is removed from the file, it will not be possible to open the file with Word anymore. It is also possible to remove the association to some file type and it will become possible to open the file with any other application. In the example above, the association of the document with Microsoft Word has been removed, making the document editable with any other text editor. Association is applied only for application editors, not for applications that can open or edit any file. For example, in the example above, Microsoft Word is associated with PDF documents and only the application is associated with it, but the document is still not associated with Word. In the example above, it is still possible to open the document with any application since it is not associated with the Microsoft Word application anymore. By default, the association is done for all files and types, and only after that, the administrator can change this setting or disable the application association. To learn how to associate a file or type with a particular application, open the file, click the File menu, select Associations..., and the list of programs associated with the type or file will appear. By default, the administrator will see the programs that are installed on the computer, but it is possible to specify some or all of them in the list. If the administrator chooses to not see a program, it will not be listed in the list of programs associated with that type. It is also possible to remove the association of a file or type with an application, which will make the file or type editable by any other application instead of the program specified. In the example above, the administrator has removed the association for Microsoft Word, making it possible to
