For a tutorial on Photoshop, visit [www.tutorialforphotoshop.com](http://www.tutorialforphotoshop.com). Deciding which image editing program to use depends on the image's intended use. For example, someone taking photos of an event could use either Photoshop or an inexpensive photo editing software, although Photoshop is a software package that is used and necessary for serious and professional level work. I recommend that you visit [www.Adobe.com](http://www.Adobe.com) and start your Photoshop exploration through the website's free tutorials. Alternatively, you can purchase a DVD or CD of free Photoshop tutorials. \* \* \* # Working with multiple channels One of the most significant features of Photoshop is its ability to work with multiple color and grayscale channel images simultaneously. This functionality enables you to add additional information or changes to multiple images at once. For example, if you had five photos in which two were in color, three were in black-and-white, and one was in grayscale, you could accomplish the following: \* Add a dark line to the grayscale image and darken the line in the other three images. \* Lighten the grayscale image to increase the contrast and thus make the image appear black-and-white. \* Add three colors to the grayscale image. \* Save the final file. You can use similar functionality to add information to and make changes to multiple images. Some versions of Photoshop, however, don't support a full eight-channel set of images, which can result in strange or odd colors in some areas. When in doubt, you can add more than one channel to images to create more complex effects. \* \* \* Chapter 5 # Going to Print IN THIS CHAPTER Making adjustments to a print Setting up an entire output process Choosing a printer Checking the paper Getting the best results Wanting to produce a print for your client but don't know where to begin? Q: How to create an uninstaller and application for a c# windows form application I have a c# windows form application which is used as a standalone program with no databases. I have added a simple "uninstaller" using ClickOnce like this: Now when I install it, it installs fine and runs fine. However, once I have uninstalled it, I can run the application again without it asking me to download the installation again. However, I have since realised that my end users cannot use the program the next time they open it. Is there a way that I can provide them with an "uninstaller" that removes all the files but keeps their configuration and settings? This way they can reinstall without it asking them to download the installation again. Thanks. A: Is there a way that I can provide them with an "uninstaller" that removes all the files but keeps their configuration and settings? You can update the application to include a setup.exe executable file. You can add an uninstaller that removes that file as well. A better approach would be to add a simple exe to the app that drops a few files into the C:\ProgramData\Your Company\Your App folder. { "\_args": [ [ "batch@0.5.0", "E:\\[?]\\workpace\\web\\webpack-demo" ] ], "\_development": true, "\_from": "batch@0.5.0", "\_id": "batch@0.5.0", "\_inBundle": false, "\_integrity": "sha1-NDaPy8cwYBBW1U0tiyiKMnL3Aw8=", "\_location": "/batch", "\_phantomChildren": {}, "\_requested": { "type": "version", "registry": true, "raw": "batch@"
