i was once at an initial job interview with a group of senior team members, the three of us were a total of maybe an hour or so into the interview and the phone was now ringing. talk about interruption? im not saying that others arent allowed to call or that we all have to answer or ignore it, im just saying its surely a strange way to practice the three ps of any strategy, which are plan, prepare, and deliver. if you ask me, its way too quick to answer a ringing phone in an interview and, even worse, to answer it yourself and speak to an external stranger out of the context of your own team. and then the next time youre in a situation where youre feeling valued and theyre not interrupting a good flow, theyre not really practicing the three ps of a strategy, a plan, a prepare, and deliver. in fact, theyre just being rude! and im not even going to talk about how rude its going to make you seem if you dont answer the phone in an interview! consider the following: what are the implications of the speed of thought on how we fit in, and how we fit in is a key to the quality of our mental state. we are social creatures - studying and working alone may not be possible for us. if being productive requires the isolation of one or two tasks, without the social support that feeds it, we are more likely to burn out. the speed of thinking also affects our ability to imagine the world around us. we can only construct a mental model of the

---

future using the information presented to us in the present moment ( walker, 2013 ). our best mental images of the future come from our previous experiences and those of our peers, and, if we are no good at envisioning, we may be missing out on vital opportunities. when we are caught by surprise, we experience heightened emotions, and, even before our brains can work out the reaction, those feelings can take over. moreover, the physiological effects of surprise are evident in stress hormones and the hormones of fight or flight. our brain knows that our nervous system is involved with emotions, and it knows how to respond via the activation of the amygdalo dorsomedial shell (cortex and subcortex) and the mesolimbic reward system of the brain ( walker, 2013 ).

following the trend, the dsm-5 has recently become the new id diagnostic system, which will be updated with the release of dsm-5 in may of this year. the dsm system is a major revision of the fourth edition (dsm-iv) and is intended to have the same diagnostic reliability of the first edition (dsm-i), and is based on the findings of the past 40 years of research in the field. when dsm-5 was published, its diagnostic criteria were published online as a free

---

online course that is part of the website of the publisher. the first edition of the dsm, dsm-i, was published in 1952. the purpose of the manual was to provide clinicians with a systematic classification of mental disorders according to their symptomatology and the impairment they cause. the manual was developed over 10 years by a group of leading psychiatric authorities, including sigmund freud, hans eysenck, hans selye, and alfred adler. they called it the diagnostic and statistical manual of mental disorders, and it is commonly referred to by its acronym, dsm. in the 1970s, a new controversy emerged over how to define and diagnose mental disorders. the diagnostic and statistical manual of mental disorders, third edition, text revision, or dsm-iii-r, was published in 1980. this edition, which was developed under the leadership of allen frances, divided mental disorders into three broad categories: axis i, which includes those disorders that are best treated with psychotherapy; axis ii, which includes those disorders that are best treated with psychotropic medications, or medications used for side effects in the psychotherapy; and axis iii, which includes those disorders that are best treated with other medications or devices. the new edition of the manual was intended to be more comprehensive and accurate. as a result, the new edition had a greater emphasis on defining and

---

classifying mental disorders and a lower emphasis on diagnosis. the number of diagnoses was increased from around 200 to nearly 400.
