# Personal Trainer Ethan Crack [TOP]

ethane, like all ngl's, is a liquid underground, but becomes a gas under standard surface pressures and temperatures. ethane is separated from the gas stream in a processing facility where different pressures and temperatures are applied to draw off each of the gases separately. de-ethanization occurs when the boiling point for only ethane is reached, turning it into a gas. as the planet burns, we should be thankful we live in a pop culture landscape in which ethan hawke continues to be a thing. ever since 1985's explorers, a movie we haven't seen and, frankly, are not going to see, hawke has been pumping out high quality work (and silly superhero shows triggering everyone, because in our burning planet everything triggers everyone except for the fact that the planet is burning). a real renaissance man, hawke is of course a celebrated actor, but he's also done theater, tv-shows, novel and comic book writing, and has even dipped his toes in good ol' hollywood nepotism, sci-fi, we meant sci-fi. what a legend. purity ethane (at least 90% ethane, but usually higher) then travels in a pipeline to its destination, an ethane cracker plant. at the cracker plant, which has access to a large energy source, ethane is heated to about 1500 degrees fahrenheit. this process is called cracking, because heat energy is used to break apart or crack molecules to form new molecules. at that temperature ethane ( $C_2H_6$ ) molecules lose two hydrogen molecules, which split off to form a separate, stable hydrogen molecule ( $H_2$ ), leaving molecules which are about 80 percent ethylene ( $C_2H_4$ ).

## Personal Trainer Ethan Crack

in the petrochemical industry, the ethylene molecules react with oxygen molecules to form molecules of carbon monoxide, carbon dioxide, and water, which are expelled in the exhaust as a gas or vapor, and the ethane left in the cracked gas is recycled back to the cracker plant for the next cracking round. however, there are a few problems with this process. one is that the ethylene molecules have to be cracked to a very high degree, so that they lose two hydrogen molecules and turn into ethylene. this means that to make ethylene from natural gas, about a third of the gas has to be passed through the cracking process before the ethylene can be recovered. however, even though this process does not produce very much ethane, it has another problem. it produces carbon dioxide, which is a greenhouse gas, which means that if the carbon dioxide produced from cracking natural gas is not removed from the process, this greenhouse gas will be a pollutant. 1. ethan is a keen environmentalist. i think the environmentalist movement needs more people like that. people who are actively engaged in trying to make the world a better place. if youre a person who thinks of environmentalism as a political issue or youre a person who thinks of environmentalism as a religious issue, then youre missing the whole point, which is that its a human issue. its about how do we all live together on this planet. i think there needs to be a more humanistic approach, where we are more concerned about each other, and less concerned about our differences and our problems. 2. hes not so much interested in acting in the future, hes already acting. he said, i dont think of it as acting. i think of acting as something you do to solve a problem. i do it to get my head together, to make myself feel better, to get perspective. its acting, but its not acting. its not pretending or lying or masking. its not being a different person. its about living the way you want to live. its about living a life that you can feel good about. hes not shy about admitting hes passionate about his work, but hes clear hes not interested in acting as the end-all, be-all of his career. he said, i want to be the best person i can be and the best person i can be is one who is helping people. im helping people all the time. hes really passionate about this work, and he has a role in life that he wants to play. 5ec8ef588b
